

Situation	Task	Action	Result	Lesson learned
As a program QE or core QE After Yield 3.0 program, I owned and led MY26 program to work through EPDP phases. This program primarily was focused on implementing Automation feature like ground speed automation, combine auto unload, 32 bit architecture, jD Starlink boost provisions, smart data capture controllers. This was for , S700, S500, T series	My task was quality integration, guide the cross functional teams through all phases of EPDP and deliver the program successfully and guide my 9 quality engineers by influencing without authority.	I reviewed the charters and understood scope and features. Started networking with people based on my previous experiences it was the key. For each phase of program, I worked on quality planning and started going through activities related to it proactively. Fortunately, all of the core team members were great and helped on my asks and questions timely. Worked with all quality engineers on Majority of NCCAs, workflow, pfmeas etc presented information to factory leaderships time to time on quality activities, risks and mitigation. Mentored and helped a couple of engineers who were assigned to build support in factory in identifying their resourced and needs. Took ownership across all phases and went above and beyond to help others. Worked through pdp to ofp transitions executed the program in the factory until the machines were released for shipping. Encouraged team time to time during all the phases and appreciated loudly and recognized people on the go	I was able to deliver the program on time and successfully with out much hick ups. There were no last-minute surprises. There were 96 new parts and systems. Managed 76 NCCAs, and around 40 deviations. 300 plus PFMEA with around 18 of them were High RPM were mitigated using CVML systems. 1500 or Automation related Vision Events were processed related to machines that were running in the field The machines are running the field now not heard any major warranty on the PDP features. Canadian dealers are working closely on PDI. Cost saving of 310 dollars. Implementing this program enhanced field productivity by around 20 percent and this is the customer feedback. This is across our combine portfolio.	I can handle projects, can shine and communicate well. I demonstrated my abilities to consistently perform, engage, grow in relationships, ownership, technical leadership, integrity, passion, drive actions, execution, collaboration, adaptability and continuous improvement I represented quality well through out the program
