

Resume Audit Report

Hussein Baderdine — B.S. Software Engineering, Iowa State University

Scored against the Impact Bullet Builder framework

01 Overall Score

56

out of 100

10–30 ★ What Was Asked

31–60 ★★ Above & Beyond

61–100 ★★★ Impact

5/10

Accomplishments

Half the bullets describe activities, not results

3/10

Metrics

3 of 11 bullets have a real number

7/10

How / Method

Strong — tools and methods named throughout

2/10

Why / Impact

Only 2 bullets connect results to a business outcome

★★ — You Went Above and Beyond the Format. Now Put In the Numbers.

You've done something most entry-level engineers haven't — you tailored this resume to a specific role, used strong action verbs throughout, and kept personal ownership in every bullet. That gives you a real head start. But the resume is scoring low on the two factors that matter most to hiring managers: measurable outcomes and business impact. Right now, 9 of your 11 bullets describe what you did without showing what happened because of it. One targeted rewrite pass — adding real numbers and "why this mattered" context — would push this score from ★★ to ★★★ territory.

Key Issues Identified

1

The "Why" is almost completely missing — 9 of 11 bullets have no business outcome

This is the single biggest driver of your 56/100 score. The Impact Bullet Builder formula requires every bullet to explain why the result mattered — cost saved, time reduced, revenue generated, users impacted, risk mitigated. Most of your bullets stop right before that step. "Delivered 6+ user stories per sprint" tells me what you accomplished. But what did those user stories enable? What shipped? What was the business outcome for ASSA ABLOY? Without that final clause, hiring managers can't distinguish your output from any other intern's. This one fix across your 8 affected bullets would raise your score to approximately 76/100.

2

Only 3 of 11 bullets have a real number — 8 bullets are unquantified

Your three quantified bullets are strong: "3 anchor clients within the first 30 days," "6+ user stories per sprint at a consistent 5-point average," and "sub-200ms sync latency." The other 8 have no number at all. "Deployed front-end improvements... that reduced page load latency for factory operators" — by how much? 10ms? 500ms? 60%? The number doesn't have to be dramatic to work; it just needs to exist. A conservative, honest estimate is better than nothing, because "nothing" reads as either unmeasured or unmemorable. Every bullet that can take a number should have one.

3

The Odoo positioning commentary is consuming the space where results should live

Seven of your bullets end with a phrase that explains why the experience is relevant to Odoo — "directly mirroring Odoo's AE model," "gaining firsthand ERP and enterprise software context to draw from when advising Odoo prospects," "replicating the project management and demo-delivery rhythm Odoo AEs execute with every prospect." The intent is smart. The execution works against you. Hiring managers already know why they're reading your resume. These phrases burn 15–20 words on advocacy the reader doesn't need — words that could instead be a specific metric or a business outcome. Cut the Odoo commentary. Put a number there instead.

4

Six bullets describe activities, not accomplishments

Take "Bridged technical and business conversations with decision-makers ranging from architects to procurement managers, developing the multi-stakeholder fluency central to enterprise SaaS sales." That describes something you did repeatedly — not a result of doing it. What deal closed because of that conversation? What proposal got approved? What relationship turned into revenue? The IBB accomplishment test is simple: did something change because of this bullet? If the answer is "not explicitly," it's still a duty description. Apply the test to every bullet that doesn't contain a result statement.

5

The quality gap between your best and worst bullets is too wide

Bullet 3 from Upscale Interiors — "Built a structured outreach pipeline... generating repeat business from 3 anchor clients within the first 30 days" — is a genuine ★★★ bullet. It has a method, a metric, a timeframe, and a business result. Then the very next bullet from the same role is a ★ duty bullet with zero metrics. A hiring manager reading consecutively loses confidence that the strong bullet represents your standard. The goal isn't to rewrite your worst bullets up to ★★★ on the first try — it's to bring every bullet to at least ★★ so there's no cliff drop in quality from one line to the next.

03 Top Bullets — Rewritten

The 5 bullets with the highest improvement potential, rewritten using the Impact Bullet Builder formula (Accomplishment + Metric + How + Why).

Brackets like [X] are placeholders — only you know the real numbers. Fill them in with your best honest estimate. A conservative guess beats a blank every time.

IT DEVELOPER INTERN — ASSA ABLOY CURRIES

ORIGINAL (★★★ nearly there — just missing Why)

"Delivered 6+ user stories per sprint at a consistent 5–point average in a cross-functional Agile team, building the structured pipeline discipline that translates directly to managing an active sales book."

REWRITTEN (★★★)

"Delivered 6+ user stories per sprint at a consistent 5–point average in a cross-functional Agile team — the highest individual throughput on a [X]–developer team — shipping factory floor tooling features that reduced operator data-entry time by approximately [X]% across [X]+ production workstations."

What changed: Removed the Odoo commentary. Added comparative context ("highest individual throughput"), added Why (what the features actually enabled for factory operators).

IT DEVELOPER INTERN — ASSA ABLOY CURRIES

ORIGINAL (★★★ nearly there — just missing Metric)

"Deployed front-end improvements via Azure DevOps CI/CD pipelines that reduced page load latency for factory operators, gaining firsthand ERP and enterprise software context to draw from when advising Odoo prospects."

REWRITTEN (★★★)

"Deployed front-end improvements via Azure DevOps CI/CD pipelines that reduced page load latency by [X]% for [X]+ factory operators — decreasing daily friction on production floor workflows used across [X] manufacturing lines."

What changed: Added the % improvement and user count (Metric), added scope of impact on manufacturing lines (Why). Removed the Odoo commentary.

PROJECT — WATCHTOWER (AI DEPENDENCY MANAGEMENT TOOL)

ORIGINAL (★★ — has Accomplishment + How, missing Metric + Why)

"Built a full-stack SaaS tool that monitors software dependencies and surfaces upgrade risks in real time, demonstrating the product-building depth that enables credible, technical Odoo demos."

REWRITTEN (★★★)

"Built WatchTower, a full-stack SaaS tool in TypeScript and Node.js that monitors software dependencies via GitHub webhooks across [X] active repositories — surfacing upgrade risks in real time and preventing [X] critical compatibility breaks during the first [X] months of active use."

What changed: Named the tech stack inline (the header tech call-outs don't show in all resume parsers), added repository count (Metric), replaced the Odoo framing with a concrete business outcome (prevented compatibility breaks).

SALES ENGINEER — UPSCALE INTERIORS

ORIGINAL (★ — has How, missing Accomplishment + Metric + Why)

"Owned the full sales cycle end-to-end — qualifying inbound leads, running product consultations, presenting pricing, and closing contracts — directly mirroring Odoo's AE model."

REWRITTEN (★★★)

"Owned the full sales cycle from first contact to signed contract — qualifying [X] inbound leads per month, running product consultations, and closing [X] contracts — generating approximately \$[X] in revenue and achieving a [X]% close rate within the first [X] weeks."

What changed: Added lead volume and close count (Metric), added generated revenue and close rate (Why / Accomplishment). Removed the Odoo positioning. Same claim, completely different level of evidence.

PROJECT — WATCHTOWER

ORIGINAL (★★★ nearly there — has Accomplishment + Metric + How, just missing Why)

"Implemented webhook synchronization with BDD acceptance tests, achieving real-time repository monitoring with sub-200ms sync latency."

REWRITTEN (★★★)

"Implemented GitHub webhook synchronization with BDD acceptance tests, achieving sub-200ms sync latency across [X]+ monitored repositories — ensuring dependency alerts surface before engineers push downstream changes, eliminating stale-cache false negatives that broke the feedback loop."

What changed: Added scope count (Metric), added Why — what the sub-200ms latency actually enables and what problem it prevents. One sentence of context makes the technical benchmark feel real instead of arbitrary.

Before & After — Best Examples

BEFORE (★ Level) — Sales Engineer, Upscale Interiors

"Translated complex technical product specs into ROI-focused proposals for contractors and designers, consistently tying solutions to the client's workflow inefficiencies."

Why it fails: No accomplishment (what closed? what improved?), no metric, no specific method, no business outcome. Describes an activity, not a result.

AFTER (★★★ Level)

"Translated technical product specs into ROI-focused proposals for [X] contractors and designers, framing wall panel solutions around workflow and installation inefficiencies — proposals had a [X]% approval rate and contributed to \$[X] in closed contracts during the engagement."

What changed: Added proposal volume (Metric), added approval rate and revenue contribution (Why / Accomplishment). All four IBB components now present.

BEFORE (★ Level) — IT Developer Intern, ASSA ABLOY

"Authored technical documentation consumed by both developers and non-technical business stakeholders — sharpening the ability to simplify complexity and communicate value, a daily requirement in Odoo product demos."

Why it fails: No accomplishment, no metric, no specific method, and the "Why" is personal development ("sharpening the ability") rather than a business outcome. The Odoo commentary replaces a result.

AFTER (★★★ Level)

"Authored [X] pages of technical documentation for a factory-floor web application — bridging developer implementation notes and non-technical operator onboarding guides — reducing new-user onboarding time from [X] days to [X] days and cutting support ticket volume by approximately [X]%."

What changed: Added volume (pages authored), specific audience (Metric + How), and an actual business result (reduced onboarding time and support tickets). Those numbers are exactly the kind you can estimate if you ask yourself "what would have happened without this documentation?"

 BEFORE (★ Level) — Project: CyFinance

"Led a 4-person team through full Agile sprints — owning backlog grooming, sprint demos, and stakeholder communication — replicating the project management and demo-delivery rhythm Odoo AEs execute with every prospect."

Why it fails: No accomplishment (what did the project deliver?), no metric, and the Odoo framing replaces what the team actually shipped. "Led a 4-person team" with no outcome is a role description, not an achievement.

 AFTER (★★★ Level)

"Led a 4-person team through [X] Agile sprints — owning backlog grooming, sprint demos, and stakeholder check-ins — delivering a full-stack Android finance app with SpringBoot backend and MySQL data layer on schedule, with [X] core features shipped and [X] test coverage."

What changed: Added sprint count, named the actual deliverables (mobile app, backend, data layer), added "on schedule" as an outcome, and included features shipped and test coverage as metrics. The Odoo framing is gone — the work speaks for itself.

05 Top Action Items

1 Strip every "...which translates to Odoo" phrase and replace it with a number

Go through every bullet and find the phrases that end with role-relevance commentary — "directly mirroring Odoo's AE model," "to draw from when advising Odoo prospects," "Odoo AEs execute with every prospect." Delete them. In that freed-up space, put the result you were avoiding: how many contracts, what revenue, what efficiency gain, what user count. This single pass would affect 7 of your 11 bullets and would be the highest-ROI 30 minutes you spend on this resume.

2 Add at least one number to every bullet that doesn't have one

8 of your 11 bullets have no specific number. Go through each one and ask yourself: how many? how much? how fast? how often? how long did it take? You don't need exact data — a defensible estimate with honest rounding works. "Approximately \$X in revenue," "roughly X% faster" is far stronger than no number at all. Write down your best guess, and adjust if you're asked about it in an interview. Being able to explain your estimate is actually impressive.

3 Expand CyFinance from 1 bullet to 2–3 bullets with outcomes

You led a 4-person team through a full Agile process to build a mobile finance app with a SpringBoot backend, MySQL database, and GitLab CI/CD — that's multiple distinct accomplishments compressed into one underpowered bullet. Separate the leadership story from the technical story from the delivery outcome. Three bullets at ★★ are stronger than one bullet at ★. At minimum, add a second bullet that describes what the app actually does, how many users it supports, and what the CI/CD pipeline enabled.

4 Apply the "So What?" test to every bullet before finalizing

After writing each bullet, read it aloud and ask "So what?" If you can hear a logical follow-up answer that belongs in the bullet but isn't there, add it. "Deployed CI/CD improvements that reduced page load latency for factory operators" → so what? → operators could complete their input tasks faster, reducing downtime per shift. That answer belongs in the bullet. This test takes 10 seconds per bullet and catches the "almost there" cases that are holding your score down.

5

Gut the professional summary or cut it entirely

Your summary currently reads as a cover letter paragraph — "the exact profile Odoo Account Executives are built on." That's persuasive language for a cover letter, but on a resume it feels like telling the hiring manager what to think instead of showing them evidence. Either replace the summary with 2–3 tight bullet points of your top quantified achievements (what a recruiter would skim for in 6 seconds), or remove it and let your experience section lead. The summary as written is not adding credibility — the bullets you haven't yet quantified would do more.

What's Already Working

✓ **Action verb usage is excellent — every bullet scores 10/10**

Owned, Translated, Built, Bridged, Delivered, Authored, Deployed, Collaborated, Implemented, Led — every bullet opens with a first-person active verb. None of the banned openers ("Responsible for," "Assisted with," "Helped with") appear anywhere. This is a genuine strength that most candidates in your category get wrong. Don't change any of these openings.

✓ **Personal ownership is 100% consistent — no "we" language anywhere**

Not a single bullet uses "we," "our team," "supported," or "contributed to." You claim every piece of work in first person. On a resume scored by a hiring manager or ATS, this signals confidence and individual ownership. It's a harder discipline than it sounds — a lot of engineers dilute their strongest work with team language. You've already avoided that trap.

✓ **Bullet 3 (Upscale Interiors) is a genuine ★★★ — preserve it as your template**

"Built a structured outreach pipeline targeting commercial renovation projects, generating repeat business from 3 anchor clients within the first 30 days." This bullet has all four IBB components: an accomplishment (repeat business generated), a metric (3 anchor clients, 30 days), a method (structured outreach pipeline targeting commercial renovation), and a why (the outcome goes beyond the activity). This is the quality standard every bullet on the resume should be reaching for.

✓ **The resume is obviously tailored — that's harder to do than most candidates think**

You connected your software engineering internship to ERP context, your sales experience to B2B deal cycles, and your project work to product knowledge. Most engineers send generic resumes and hope for the best. The strategic awareness you've shown here is exactly right — the execution just needs the outcomes to match the framing.

✓ **Role-level tech stack headers add method context that bullet parsers miss**

Calling out "Java • Azure DevOps • CI/CD • Tomcat • AJAX • JSON • Agile" directly under the ASSA ABLOY role title is a smart move — it front-loads the technical context before the bullets, making the How criterion easier to pass for the bullets beneath. Same for the project tech headers (TypeScript • Node.js • GitHub API). Keep this format.

CRITERIA	SCORE	OBSERVATION
1. Accomplishments (not duties)	5/10	5 of 11 bullets describe a concrete result. The other 6 describe activities or responsibilities. Bullets 2, 4, 6, 8, and 11 are the clearest examples needing a result clause added.
2. Metrics / Quantification	3/10	Only 3 of 11 bullets contain a specific number: "3 anchor clients / 30 days," "6+ stories / 5-point average," "sub-200ms." The remaining 8 need at least one defensible estimate each.
3. How / Method Shown	7/10	7 of 11 bullets name a specific tool, method, or process. Upscale Interiors bullets 2 and 4 and the documentation bullet lack a named method. The tech stack call-out headers help fill this gap across the ASSA ABLOY and project sections.
4. Why / Business Impact	2/10	Only 2 of 11 bullets connect results to a business outcome: Bullet 3 (repeat business from anchor clients) and Bullet 7 (latency reduced for factory operators). The rest stop at the activity or result without explaining stakes or downstream impact.
5. Personal Ownership	10/10	Perfect. All 11 bullets use first-person active voice. No "we," "our team," "supported," or "contributed to" language appears anywhere in the experience or project sections.
6. Problem Context / "So What?"	5/10	5 of 11 bullets provide some before/after framing or scale statement — Bullets 3, 5, 6, 7, and 10. The remaining 6 describe the action without any context for what the situation was or how much it changed.
7. Action Verbs	10/10	Perfect. Owned, Translated, Built, Bridged, Delivered, Authored, Deployed, Collaborated, Implemented, Built, Led — every bullet opens with a strong, specific action verb. No banned openers appear.

CRITERIA	SCORE	OBSERVATION
8. Bullet Quality Consistency	3/10	The spread is ★ to ★★★ — a 2-tier gap. 6 of 11 bullets are ★-tier, 1 is ★★-tier, and 4 are ★★★-tier (Bullets 3, 5, 7, 10). The majority landing at the bottom tier creates a noticeable quality cliff that undermines the strong bullets. Goal: bring all bullets to ★★ minimum.
OVERALL SCORE	56/100	★★ — You Went Above and Beyond

The Good News

You're sitting at 56/100 — and notably, two of the eight criteria are already at 10/10. That's not common. Your action verb game and personal ownership are already at the level you'd see on a well-coached senior engineer's resume. The gap between your current score and 80+ isn't a gap in ability or experience — it's a gap in how consistently you've applied the Impact Bullet Builder formula. You have at least four strong ★★★ bullets on this resume, which means you already know how to write them. The remaining seven bullets just need the same treatment: a specific number, a named tool, and one sentence that tells the reader what was different in the world because of what you did. Apply that pattern and the score moves significantly.

L2

LaunchToLead

Want Help Fixing All of This?

This audit covered your top 5 bullets. The other bullets on this resume have the same potential — they just need the same treatment applied consistently across every line.

The 21-Day Accelerator is 3 one-on-one sessions designed to take your resume from where it is now to where it needs to be — and then prepare you to walk into any interview and own it.

1

Resume Rebuilt

Every bullet rewritten using the Impact Bullet Builder formula. Every number tracked down or estimated. Every Odoo positioning phrase replaced with a real outcome. Your name on a ★★★ resume at the end of this session.

2

Interview Stories Mastered

A complete master story bank built from your actual experience — every major behavioral question mapped to a specific story from your time at Upscale Interiors or ASSA ABLOY, structured in STAR format and ready to deliver under pressure.

3

Live Mock Interview

A full simulated interview round with real-time feedback — what landed, what didn't, and exactly how to adjust before you're in front of the actual hiring manager.

You leave with:

A rebuilt resume · Master story bank · Mock interview notes · All session recordings · 40+ bonus materials
