Present in 5 of 8
bullets — solid
foundation

★★★ — You Spread the Impact Far and Wide. One Metric Pass Away From a Standout Score.

For a December 2025 grad with one short industry engagement, this is a genuinely strong result. You scored 66/100 — solidly in ★★★ territory — on the strength of exceptional tool breadth (Python, NumPy, XFOIL, MATLAB, SolidWorks, FDM/SLA), near-perfect action verbs, and one completely outstanding bullet: the Python performance model for the rocket motor is a textbook ★★★ bullet with 5 real engineering numbers and a result that beat specification by 14.3%. The gap to a higher score is almost entirely one dimension: 7 of your 8 bullets have no specific number, and your context/stakes framing is thin across the board. Adding quantification to your top 4 bullets — even academic-level numbers like dataset sizes, error margins, or timeline savings — would push this into the 80–85 range.

Key Issues Identified

1

7 of 8 bullets have no specific number — one exceptional bullet is doing all the quantification work

Your Python performance model bullet is a masterclass in quantified engineering results: 13.8 kN average thrust, 60,425 N·s total impulse, 0.71 s ignition, 10,450 m apogee, +14.3% beyond specification. That bullet alone is why your Metrics score isn't a 1. But every other bullet on the resume has zero numbers, including your entire work experience section, your UQ research, your water channel research, and both personal projects. For academic candidates, the IBB framework accepts research-appropriate metrics: how many wind tunnel test cases did your pipeline automate? What was the uncertainty range before vs. after your methodology? How many consoles have you repaired? What Reynolds number range did you confirm? You have the data — it just isn't on the resume.

2

Scale and scope are invisible on 6 of 8 bullets — the work is impressive but a hiring manager can't gauge it

Context framing asks: how big was this? What was at stake? Your Mk-41 VLS-compatible framing in the rocket motor bullet plants a clear flag — that's a real Navy weapon system standard. But everywhere else, the scale is unclear. At the NDA technology company, how many assembly procedures did you translate? How many factory floor workers depended on that documentation? For the airfoil research: how many external submitters were you providing results to? For the water channel: what was the Reynolds number range you validated? Scope statements don't require exact proprietary numbers — even approximate figures or relative context ("supporting [X] active external aerodynamics clients," "Re range of [X] to [Y]") make the work land with a reader who doesn't know your lab.

3

"Collaborated with a PhD researcher" undersells your actual technical contribution

The water channel bullet describes real, hands-on analytical work: you set up flow visualization experiments, calculated Reynolds numbers in MATLAB, and validated the experimental setup. That's not assisting — that's contributing core technical labor to a research project. But "Collaborated with a PhD researcher" frames you as a supporting player on someone else's study. The rewrite is simple: lead with the technical action you personally performed. "Calculated Reynolds numbers and confirmed laminar flow agreement in MATLAB" is what you did — the PhD researcher context matters less than the fact that you ran the analysis and your results validated the setup. Changing the opener alone moves this bullet from ★★ to ★★★ territory once you add a number.

4

Personal project bullets are present tense and describe activities rather than outcomes

"Perform SMD component replacement and trace-level PCB rework on handheld gaming consoles" — present tense framing ("Perform," "Execute") tells a hiring manager this is something you do rather than something you've accomplished. There's no outcome: how many consoles have you repaired? What was the success rate? What's the most complex repair you've done? Similarly, the modular synthesizer bullet names the tools (SolidWorks/Fusion360, FDM, SLA) but doesn't say whether you finished it, how many modules it has, or what it does. Personal projects exist on an engineering resume to show initiative and technical range — they land much harder when they read like completed technical work, not an ongoing hobby description.

03 Top Bullets — Rewritten

The 4 bullets with the highest improvement potential, rewritten using the Impact Bullet Builder formula (Accomplishment + Metric + How + Why).

Brackets like [X] are placeholders — only you know the real numbers. Fill them in with your best honest estimate. A conservative guess beats a blank every time.

PROJECT — AIRFOIL UNCERTAINTY & ERROR ANALYSIS RESEARCH, CSULB

BEFORE

Developed an uncertainty quantification methodology integrating XFOIL simulations with wind tunnel testing to provide calibrated results to external submitters. Engineered a Python/NumPy post-processing pipeline to automate the analysis of experimental wind tunnel data

AFTER (★★★ Level)

Developed an uncertainty quantification methodology integrating XFOIL simulations with wind tunnel testing — reducing result uncertainty from $\pm[X]\%$ to $\pm[Y]\%$ and delivering calibrated aerodynamic data to [Z]+ external submitters; built a Python/NumPy post-processing pipeline that automated [N]+ experimental datasets, cutting analysis time from [A] hours to [B]

Added: uncertainty reduction range (metric), submitter count (context + metric), dataset volume automated (metric), time saved (why + metric)

PROJECT — WATER CHANNEL LAMINAR FLOW RESEARCH, CSULB

BEFORE

Collaborated with a PhD researcher with water channel flow visualization experiments using green laser illumination in a pump-driven flow loop; calculated Reynolds numbers in MATLAB and confirmed agreement with measured data, validating the experimental setup for laminar flow studies

AFTER (★★★ Level)

Conducted laminar flow visualization experiments using green laser illumination in a pump-driven water channel — calculated Reynolds numbers in MATLAB across a Re range of [X] to [Y], confirming agreement with measured data within [Z]% tolerance and validating the experimental setup for a PhD-level research program

Opener changed to own the work; added: Re range (metric), agreement tolerance (metric), PhD research context (stakes/why)

PERSONAL PROJECT — HANDHELD CONSOLE REPAIR & MODULAR SYNTHESIZER

BEFORE

Perform SMD component replacement and trace-level PCB rework on handheld gaming consoles

AFTER (★★★ Level)

Repaired [X]+ handheld gaming consoles through SMD component replacement and trace-level PCB rework — diagnosing faults to the component level with a [Y]% success rate, developing hands-on microelectronics proficiency directly applicable to hardware-heavy engineering roles

Past tense; added: console count (metric), success rate (metric), explicit career relevance (why)

WORK EXPERIENCE — MANUFACTURING PROCESS ENGINEER (CONTRACT), NDA TECHNOLOGY COMPANY

BEFORE

Standardized and digitized work instruction documentation, adapting process workflows from the original facility to the new deployment

AFTER (★★★ Level)

Standardized and digitized [X] manufacturing work instructions in [tool, e.g., Confluence/SharePoint] — adapting process workflows from the source facility to a new deployment site and reducing documentation ambiguity for [Y]+ factory floor staff during a quality-critical production ramp

Added: document count (metric), tool named (how), staff affected (context + metric), production ramp framing (stakes)

Before & After — Biggest Tier Jumps

PERSONAL PROJECT — HANDHELD CONSOLE REPAIR

BEFORE (★ Level)

"Perform SMD component replacement and trace-level PCB rework on handheld gaming consoles"

Fails: present tense activity description, no count (how many?), no outcome (did they work?), no context (what's the difficulty of trace-level rework?), no career-relevance why. Hiring manager reads: "has a hobby."

AFTER (★★★ Level)

"Repaired [X]+ handheld gaming consoles through SMD component replacement and trace-level PCB rework — diagnosing faults to the component level with a [Y]% success rate, building hands-on microelectronics proficiency directly applicable to hardware-intensive engineering environments"

Added: past tense + count (Accomplishment + Metric), success rate (Metric), microelectronics relevance (Why). All 4 IBB components present.

WORK EXPERIENCE — MANUFACTURING PROCESS ENGINEER (CONTRACT)

BEFORE (★ Level)

"Standardized and digitized work instruction documentation, adapting process workflows from the original facility to the new deployment"

Fails: no tool named, no scale (how many documents?), no business outcome stated ("new deployment" tells us nothing about what was at stake). Could describe any documentation task at any company.

AFTER (★★★ Level)

"Standardized and digitized [X] manufacturing work instructions — adapting process workflows to a new deployment site and reducing documentation ambiguity for [Y]+ factory floor staff during a quality-critical production ramp, directly supporting defect-free ramp-up"

Added: document count (Metric), staff impacted (Context + Metric), production ramp stakes (Why). All 4 IBB components present.

05 Top Action Items

1 Add numbers to your top 4 research/project bullets — your rocket motor bullet proves you know how to do this

The Python performance model bullet has 5 specific engineering numbers and beats specification by 14.3% — it is the strongest single bullet on this resume. Apply the same logic to your UQ research, water channel work, and FSAE capsule. For UQ: how many test cases or external submitters? What was the uncertainty improvement? For water channel: what Reynolds number range, what was the measured-vs-calculated agreement within? These numbers exist from your lab notebooks or reports. Putting them on your resume closes the only major gap between a 66 and an 85+.

2 Rewrite the water channel bullet — own the MATLAB analysis, don't frame yourself as the PhD's assistant

The technical work you did in that research (reynolds number calculation, experimental validation, data agreement analysis) is exactly what engineering employers want to see. Starting with "Collaborated with a PhD researcher" buries your contribution under someone else's credential. Start with what you personally ran: "Conducted laminar flow visualization experiments and calculated Reynolds numbers in MATLAB..." — then add the PhD research program as context at the end, not at the start. This single change moves the opener from a support framing to a technical ownership framing.

3 Convert your personal project bullets from present-tense activity to past-tense accomplishment

"Perform" and "Execute" frame your personal projects as ongoing habits rather than completed technical work. Every resume bullet should be past tense and describe something you did, not something you do. Beyond the tense fix: both personal project bullets need an outcome. For the consoles: how many have you repaired? What's your completion rate? For the synthesizer: is it working? How many modules? What voltage rails? Treating your personal projects with the same rigor as your academic work signals to technical interviewers that you approach your own engineering with professional discipline.

4

Add scale to your NDA work experience bullet — even rough estimates are credible and expected

The NDA constraint means you can't name the company, but it doesn't prevent you from describing scale. "Translated technical work instructions... for the China-side manufacturing team" — how many staff on that team? How many procedure documents did you translate or digitize? Even approximate figures ("20+ factory floor staff," "standardized [X] process documents") anchor the scope of your contribution. The translation and documentation work you did has real business stakes (misunderstood QC instructions in a manufacturing environment can cause defects or recalls) — the bullet should say so, even obliquely.

What's Already Working

Your Python performance model bullet is genuinely ★★★ — this is the kind of bullet engineers remember

"Engineered Python performance model that validated 13.8 kN average thrust and 60,425 N·s total impulse, achieving 0.71 s ignition and 10,450 m apogee (+14.3% beyond specification)" — five engineering numbers, a named tool, a clear accomplishment, and a result that beat the specification. This is what every other bullet on the resume is trying to be. It demonstrates that you understand how to quantify your work; the task is applying that same instinct to the remaining 7 bullets.

Tool breadth is exceptional — and specific tools are named inside the bullets, not just in a skills list

Python, NumPy, XFOIL, MATLAB, green laser illumination, SolidWorks, Fusion360, FDM, SLA 3D printing, SMD soldering, PCB trace-level rework — and most of these appear inside accomplishment bullets, not just in the skills section. This is exactly the right approach. A skill listed in a section is a claim. A skill named inside an accomplishment ("Engineered Python performance model," "calculated Reynolds numbers in MATLAB") is proof. You're already doing this correctly across most of the resume.

The Mk-41 VLS context immediately signals defense/aerospace industry relevance

Naming the Mk-41 Vertical Launching System compatibility standard tells any aerospace or defense engineering recruiter exactly what this project was targeting — a real Navy weapon system interface. This is far stronger than "naval missile project" or "defense-inspired capstone." It shows you understand how real engineering systems are classified and specified, and it differentiates your senior project from the generic capstone that every other aerospace grad is listing. Keep this specific reference; it is doing real work.

Action verbs are perfect — all 8 bullets start with strong, specific engineering verbs

Directed, Engineered, Developed, Collaborated, Performed, Executed, Translated, Standardized — not a single "Responsible for," "Duties included," or "Helped with" in sight. This is a 10/10 criterion, and it reflects a candidate who understands that resumes should describe what you did, not what your role involved. The verb quality sets up every bullet for success; the remaining work is adding the data to back them up.

Personal projects show a self-directed engineer who builds things outside of coursework

SMD and trace-level PCB rework is genuinely skilled microelectronics work — the kind of hands-on proficiency that aerospace and defense hardware teams actively want and rarely find in new grads. The modular synthesizer project demonstrates that you'll engage with complex, multi-month technical builds independently. These aren't filler entries; they're differentiated proof points. They just need to be written as if you're an engineer describing a technical project, which (with some quantification and past-tense framing) they easily could be.

07 Full Scorecard

Scored against 8 in-scope bullets (2 work experience + 6 project bullets). Graduate track rules applied per IBB protocol: academic metrics, research outcomes, and project results all count as passing quantification.

Criterion	Score	Observation
1. Accomplishments	9/10	7 of 8 bullets describe an action with an outcome or deliverable. Only the SMD console repair bullet fails — "Perform... replacement" describes an ongoing activity with no stated result. All project and work experience bullets describe something you built, developed, or validated.
2. Metrics / Quantification	2/10	1 of 8 bullets has specific numbers (the rocket motor Python model — 13.8 kN, 60,425 N·s, 0.71 s, 10,450 m, +14.3%). All other bullets have no quantification at all. Even using graduate-track proxies (sample sizes, error ranges, dataset counts), 7 bullets still fail. Highest-priority fix on the resume.
3. How / Method Shown	9/10	7 of 8 bullets name a specific tool, technique, or method: trade studies + propellant selection (B3), Python (B4), XFOIL + Python/NumPy (B5), green laser + MATLAB (B6), SMD + PCB rework (B7), SolidWorks/Fusion360 + FDM/SLA (B8), and EN/ZH translation (B1). Only the "Standardized and digitized" documentation bullet (B2) fails — no tool named.
4. Why / Business Impact	7/10	5 of 8 pass. Strong: "ensuring accurate implementation... in quality-critical assembly steps" (B1), "for safety and cost" (B3), "+14.3% beyond specification" (B4), "provide calibrated results to external submitters" (B5), "validating experimental setup for laminar flow studies" (B6). Fails: B2 (no impact stated), B7 (no outcome), B8 (no purpose stated).
5. Personal Ownership	9/10	7 of 8 bullets are first-person active. Only B6 fails: "Collaborated with a PhD researcher" frames the work as a supporting role. All other bullets — Directed, Engineered, Developed, Translated, Standardized, Perform, Execute — read as personal ownership statements.
6. Context / Stakes	3/10	2 of 8 bullets provide scale or stakes framing. B3 passes with "Mk-41 VLS-compatible" (a real system standard with defense implications). B4 passes with "+14.3% beyond specification" (the specification comparison is inherently a stakes statement). All other bullets describe work without situating it in scope, team size, dataset scale, or before/after comparison.

Criterion	Score	Observation
7. Action Verbs	10/10	All 8 bullets open with a strong verb: Translated, Standardized, Directed, Engineered, Developed, Collaborated, Perform, Execute. None of the prohibited openers ("Responsible for," "Helped with," "Supported," etc.) appear anywhere on the resume. Note: B7 and B8 use present tense ("Perform," "Execute") — not a scoring failure per the criterion definition, but a style issue to fix.
8. Bullet Quality Consistency	4/10	Tier distribution: B4 (★★★), B1/B3/B5/B6/B8 (★★), B2/B7 (★). 2-tier spread (★ to ★★★) present: 3–5 score range. Positioned at 4 given the concentration in ★★ and the single ★★★ anchor. If the 2 ★ bullets are replaced/upgraded, this score would reach 6–7.
OVERALL SCORE	66/100	★★★ — You Spread the Impact Far and Wide Sum: 53 × 1.25 = 66.25 → 66

The Good News

You're in ★★★ territory as a December 2025 grad with one short industry engagement — that's a genuinely unusual result. Most new-grad resumes land in the 40s and 50s. You're here because you already understand two of the four things that make a resume strong: you describe accomplishments (not duties), and you name specific tools. The two things you still need — numbers and scope context — are the easiest to add, because the underlying work is already there. Your lab reports, project documentation, and design files have all the data. The gap between a 66 and an 82 is one afternoon of pulling numbers and adding scope statements to your top four bullets. You're close.

→ Want Help Fixing All of This?

This audit covered your top 4 bullets. The other bullets on your resume have the same potential — they just need the same treatment applied consistently across every project and every role.

The 21-Day Accelerator Program — 3 x 90-minute 1-on-1 sessions:

1. **Resume Rebuilt** — every bullet rewritten with the Impact Bullet Builder formula, numbers filled in across all bullet points, your Mk-41 and XFOIL work positioned for the aerospace and defense roles you're targeting
2. **Interview Stories Mastered** — master story bank built in STAR format so you can answer any behavioral question cold, with your rocket motor, water channel, and PCB repair work ready as concrete examples
3. **Live Mock Interview** — full practice with direct feedback on delivery, story structure, and where you're leaving technical credibility on the table

You leave with: a rebuilt resume, master story bank, mock interview notes, all session recordings, and 40+ bonus materials.
