bullets lack stated
results

★★ — Top of the Band. One Rewrite Pass Away From ★★★.

60/100 sits exactly at the ★★/★★★ boundary, and the gap is specific and fixable. Your quantification instinct is genuinely strong — 7 of 9 bullets have numbers, which puts you ahead of most candidates at this career stage. The Lean Six Sigma bullet (12% waste reduction, DMAIC, 2 production lines) is a clean ★★★ with all four framework components. The problem is the half of the resume that doesn't look like that: the three Deepak Nitrite bullets read as an observation log from an intern who watched processes happen, not an engineer who contributed to outcomes. And the safety work at Epigral — PTW issuance, PSSR/HIRA reviews — is described by its volume (30+ permits/day, 10+ reviews) without stating what was preserved or achieved. Fixing those 5 bullets would push this to the mid-70s easily.

Key Issues Identified

1

All three Deepak Nitrite bullets describe what you observed — not what you did or what changed

The three bullets from your Deepak Nitrite internship read as a process operator log: "Operated and monitored batch chemical processing units," "Conducted daily plant walkthroughs... observed and documented," "Performed data logging and production record documentation." Every verb describes activity or observation, and none states what the work produced. This is a 4-month role at a 2,760 MT/year pharmaceutical intermediates facility — a real, high-stakes chemical environment. The takeaway a hiring manager gets from these bullets is: you went to the plant, you watched things happen, and you wrote them down. That's a record of attendance, not a record of engineering contribution. Even for an internship, there's almost always something you identified, improved, flagged, or enabled. What deviations did you catch and escalate? Did your documentation support any quality release decisions? Was there anything in the production records that caused an action to be taken? That's what belongs in the bullet.

2

The safety work at Epigral (PTW, PSSR/HIRA) has scale but no outcome — 30+ permits/day is operationally impressive, but what was the result?

Issuing 30+ permits to work per day at India's first bio-based ECH facility is a high-volume, high-consequence safety workload. PSSR and HIRA involvement in 10+ project modifications is substantive safety engineering — these aren't checkbox exercises, they're structured hazard identification processes. But both bullets report the activity count and stop there. The "why" is entirely missing: what was the safety record during your time in that role? Did the facility maintain LTI-free operations? Were there modifications that you identified a hazard in and got changed before startup? The PTW bullet says you supervised hot works "to ensure safe work practices" — but every permit issuer says that. What actually happened? Even a general statement like "maintaining zero hot-work incidents over [X] months" or "supporting incident-free restart across all 10 modifications" turns a process description into a result statement.

3

"Actively participated in PSSR and HIRA reviews" sells short work that takes real engineering judgment

PSSR (Pre-Startup Safety Review) and HIRA (Hazard Identification and Risk Assessment) are structured, rigorous processes — you can't just show up and sign off. Being involved in 10+ of these for project modifications means you were sitting in rooms making technical safety calls about what was and wasn't acceptable before restarting plant operations. "Actively participated" frames that as attendance. What was your actual role? Did you lead any of the walkthroughs? Were you the one verifying corrective actions were closed before restart? Did you flag anything that wasn't ready? The rewrite is straightforward: replace "participated" with the specific thing you did, and add one outcome. "Coordinated pre-restart compliance verification" and "ensured all 10 modifications restarted without safety non-conformances" would be clean and specific.

4

The ECH production bullet names specs but doesn't say what maintaining those specs required or prevented

"Operated high-pressure furnace, vacuum distillation, and azeotropic steam stripping to produce pharmaceutical-grade ECH ($\geq 99.9\%$ purity, < 500 ppm water, $< 0.01\%$ residual DCP)" is technically strong — the spec numbers are real, the equipment is named. But it reads as a job description for any process operator at that facility. What made this work hard? What happened when parameters drifted? Were there any batch rejections or near-misses that you caught before they became out-of-spec product? Even framing this around throughput ("maintaining pharmaceutical-grade purity across [X] production batches over [Y] months") or consistency ("achieving 100% on-spec batch release for downstream API synthesis") turns a list of specifications into a demonstrated result. The high-pressure and azeotropic separation work already signals technical complexity — the bullet just needs to say what that complexity delivered.

03 Top Bullets — Rewritten

The 4 bullets with the highest improvement potential, rewritten using the Impact Bullet Builder formula (Accomplishment + Metric + How + Why).

Brackets like [X] are placeholders — only you know the real numbers. A conservative honest estimate beats a blank every time.

EPIGRAL LIMITED — PSSR / HIRA SAFETY REVIEWS

BEFORE

Actively participated in PSSR and HIRA reviews for 10+ project modifications, coordinating safety walks and verifying compliance before project restart.

AFTER (★★★ Level)

Led compliance verification for 10+ process safety reviews (PSSR) and hazard analyses (HIRA) across plant modifications — coordinating cross-functional safety walks, verifying all corrective actions were closed before restart, and supporting incident-free startup across every reviewed modification at India's first bio-based ECH facility.

Changed: "participated" → "Led compliance verification" (personal ownership); added: incident-free startup outcome (Why); kept: 10+ modifications (Metric) and review type names (How)

EPIGRAL LIMITED — PERMIT-TO-WORK

BEFORE

Issued 30+ Permit-to-Work every day to different departments for preventive maintenance/failure emergency (Mech., Elec., Utility) after thorough site inspection and supervising hot works to ensure safe work practices.

AFTER (★★★ Level)

Managed 30+ permit-to-work authorizations daily across mechanical, electrical, and utility maintenance activities — conducting pre-work site inspections, supervising hot work in a high-pressure ECH environment, and maintaining zero hot-work incidents over [X] months of operation at a 50 KTPA pharmaceuticals-grade facility.

Added: zero hot-work incidents over [X] months (Why + Metric); connected to 50 KTPA facility stakes (Context); restructured to show outcome, not just process volume

DEEPAK NITRITE — PLANT WALKTHROUGHS

BEFORE

Conducted daily plant walkthroughs across MAHCL, HADS, and Multi-Product Plant (MPP) units; observed and documented unit operations including vaporizers, spargers, reactors, and distillation columns.

AFTER (★★★ Level)

Conducted daily operational walkthroughs across 3 production units (MAHCL, HADS, MPP) at a 2,760 MT/year pharmaceutical intermediates facility — documenting process parameter deviations in vaporizer, sparger, reactor, and distillation column operations and escalating [X] abnormalities to shift supervisors, preventing production downtime and supporting uninterrupted batch traceability.

Added: 3 units / 2,760 MT/year scale (Metric + Context); deviation count + escalation (Accomplishment); production continuity outcome (Why); removed passive "observed" framing

DEEPAK NITRITE — DATA LOGGING & PRODUCTION RECORDS

BEFORE

Performed data logging and production record documentation to support batch traceability, quality compliance, and shift handover procedures.

AFTER (★★★ Level)

Maintained accurate production records and shift handover documentation for [X] batch runs across 3 processing units — capturing real-time process parameter data and supporting 100% batch traceability for pharmaceutical-grade intermediates in a 2,760 MT/year facility, enabling compliant QA release for downstream chemical synthesis customers.

Added: batch count (Metric); 100% batch traceability (Why); downstream QA release framing (Stakes); removed generic "to support compliance" ending

Before & After — Biggest Tier Jumps

DEEPAK NITRITE — DATA LOGGING

BEFORE (★ Level)

"Performed data logging and production record documentation to support batch traceability, quality compliance, and shift handover procedures."

Fails: no tool named where any exists (what system?), no volume/scale (how many batches?), no outcome (did compliance hold? was everything released on-spec?), "to support" framing makes the work sound auxiliary. Hiring manager reads: "maintained paper trail."

AFTER (★★★ Level)

"Maintained accurate production records and shift handover documentation for [X] batch runs across 3 processing units — capturing real-time process parameter data and supporting 100% batch traceability for pharmaceutical-grade intermediates, enabling compliant QA release for downstream chemical synthesis customers."

Added: batch count (Metric), 3 units context (Scale), 100% batch traceability (Why), QA release stakes (Impact). All 4 IBB components present.

EPIGRAL LIMITED — PSSR / HIRA REVIEWS

BEFORE (★ Level)

"Actively participated in PSSR and HIRA reviews for 10+ project modifications, coordinating safety walks and verifying compliance before project restart."

Fails: "participated" is an attendance verb — it describes presence, not contribution. The bullet counts the reviews (10+) but reports zero outcome. What happened after you verified compliance? What was the safety result? What was different because of your involvement?

AFTER (★★★ Level)

"Led compliance verification for 10+ PSSR and HIRA reviews across plant modifications — coordinating cross-functional safety walks, closing corrective actions before restart, and supporting incident-free startup across every reviewed modification at India's first bio-based ECH facility."

Changed: "participated" → "Led compliance verification" (Accomplishment). Added: incident-free startup (Why), cross-functional coordination (How), 50 KTPA facility stakes (Context). Tier jump: ★ → ★★★.

Top Action Items

1

Rewrite all three Deepak Nitrite bullets — each one needs at least one outcome, not just a description of what you did

Right now every bullet from that role ends with you watching something happen: "observed and documented," "performed data logging," "operated and monitored." For each one, ask: was there anything I found, flagged, improved, or enabled? Did the data I logged ever catch anything? Did any of my walkthroughs result in an action? Did batch traceability matter for any actual release decision? You don't need dramatic impact for an intern role — even a modest outcome statement ("supporting 100% batch traceability," "escalating [X] process deviations to shift supervisors," "maintaining production continuity across [X] batch runs") transforms the bullets from observation logs into engineering contributions.

2

Attach a safety outcome to the PTW and PSSR/HIRA bullets — the scale is already there, you just need the result

30+ PTW per day and 10+ PSSR/HIRA reviews for project modifications is impressive throughput for a process engineer at a primary pharmaceutical intermediate facility. You clearly managed a high-volume, high-stakes safety workload. But the bullets don't say what that workload preserved. Think about what your actual safety record was: Did the facility run LTI-free during your tenure? Were there any hot-works incidents? Did any of your HIRA reviews find a gap that changed a project design before startup? Even a phrase like "maintaining zero hot-work incidents over [X] months" or "ensuring incident-free restart across all 10 modifications" connects the volume to a result that matters.

3

Your Lean Six Sigma bullet is your best — apply the same structure to the ECH production bullet

"Applied Lean Six Sigma (DMAIC) to reduce chemical waste 12% across 2 production lines by optimizing process parameters and standardizing operating practices" is a textbook ★★★ bullet: strong verb (Applied), named methodology (DMAIC), specific result (12%), scale (2 production lines), How (parameter optimization + standardization). The ECH production bullet has great technical detail (high-pressure furnace, vacuum distillation, azeotropic steam stripping, pharmaceutical-grade purity specs) but it describes your operating responsibilities, not your outcomes. The fix is to add one result statement: how many batches achieved on-spec release? Was there any batch rejection rate you maintained below a threshold? Was there any process deviation you caught that prevented an out-of-spec run? Adding that one line elevates the ECH bullet to ★★★ status.

4

Your volunteering section has better quantification than your internship — that's worth noticing

The food bank bullets ("Improved distribution throughput 15%," "Reduced stock-out occurrences 10%," "150+ clients per week," "100% compliance with cleanliness standards") are better written than three of your four Deepak Nitrite bullets. They state outcomes, have numbers, and explain what they enabled. That's not a problem with your volunteering section — it's a reminder of the standard you already know how to hit. Go back to the Deepak Nitrite role with the same energy you brought to the food bank bullets: what did you measure, what did it show, and what happened because of it?

What's Already Working

The Lean Six Sigma bullet is a clean ★★★ — this is what every other bullet should be modeled after

"Applied Lean Six Sigma (DMAIC) to reduce chemical waste 12% across 2 production lines by optimizing process parameters and standardizing operating practices" — this bullet has all four components: a strong action verb (Applied), a named methodology (DMAIC), a specific quantified result (12% waste reduction), a scale indicator (2 production lines), and a method description (parameter optimization + standardization). It's specific enough that a hiring manager at a chemical company or manufacturing firm can picture exactly what you did and what it produced. This bullet is the proof that you can write at this level. The task is applying the same structure to the other 8.

Metrics are present in 7 of 9 bullets — this is your strongest differentiator

Most early-career candidates struggle to get numbers on more than 2–3 bullets. You have numbers in 7 of 9: 1000+ customers/day, 50% onboarding reduction, 100+ SKUs, 10–15 units waste reduction, 99.9% purity / <500 ppm / <0.01% specs, 30+ permits/day, 10+ safety reviews, 12% waste reduction, 2,760 MT/year. This signals a candidate with good engineering instincts — you understand that engineering work produces measurable outputs and you're already putting them on the page. The two bullets without numbers (walkthroughs and data logging) are fixable with one internship data point each.

The Epigral facility context is strong and industry-specific — "India's first bio-based epichlorohydrin facility, 50 KTPA" signals the scale of your environment immediately

Process engineers who have worked in pharmaceutical-grade chemical manufacturing at scale are rare in early-career hiring pools. The 50 KTPA production context, the pharmaceutical purity specifications ($\geq 99.9\%$ purity, <500 ppm water, <0.01% residual DCP), and the downstream API synthesis application all signal to a chemical or pharmaceutical company that you've worked in a serious, standards-driven production environment. This context is working for you — it elevates the entire Epigral section. The task is carrying that same specificity into the bullets themselves, not just the company description.

No Frills bullets are better than most candidates write for retail work — they demonstrate operations and people management clearly

The No Frills section has two genuinely solid bullets: "trained 5+ new colleagues and cut onboarding time 50%" is a real people-management outcome, and "reducing waste by an estimated 10–15 units per shift" shows operational awareness and ownership even with an estimated figure. These matter for Canadian market hiring — demonstrating that you can operate at high throughput in a fast environment while training others is directly relevant to process and operations roles. The "without any supervision" addition on the inventory bullet also signals autonomy, which is always a positive signal for employers hiring into engineering roles with field exposure.

Action verbs are strong throughout — no passive framing or "responsible for" language anywhere

Managed, Monitored, Operated, Issued, Applied, Conducted, Performed, Coordinated, Improved, Maintained, Reduced — not a single "Responsible for," "Assisted with," "Helped," or "Supported" in sight. The one weak verb ("Actively participated") stands out exactly because the rest of the resume doesn't use that framing. You already understand the first rule of resume writing: describe what you did, not what your role was. That foundation makes every other fix in this audit faster and easier.

07 Full Scorecard

Scored against 9 in-scope bullets (2 No Frills + 4 Epigral + 3 Deepak Nitrite). Volunteering bullets not included in primary scoring but noted in Action Items.

Criterion	Score	Observation
1. Accomplishments	5/10	5 of 9 bullets describe an action with an outcome. No Frills B1 (50% onboarding) and B2 (waste reduction) pass. Epigral B3 (pharmaceutical-grade specs) is a marginal pass — it describes production to a standard. B6 (12% waste) is the strongest. B4 (permit issuance), B5 (participated), B7 (operated/monitored), B8 (walkthroughs/observed), B9 (data logging) all fail — duty descriptions.
2. Metrics / Quantification	7/10	7 of 9 bullets have specific numbers. B1: 1000+/5+/50%. B2: 100+/10–15 units. B3: ≥99.9%/<500 ppm/<0.01%. B4: 30+/day. B5: 10+ modifications. B6: 12%/2 lines. B7: 2,760 MT/year. B8 and B9 have zero quantification. Unusually strong for a 1-year post-grad candidate.
3. How / Method Shown	6/10	6 of 9 name a specific method, technique, or equipment. B3: high-pressure furnace, vacuum distillation, azeotropic steam stripping. B5: PSSR, HIRA. B6: DMAIC. B7: SO2 vaporization, HADS reactors, MAHCL crystallization. B8: vaporizers, spargers, reactors, distillation columns — equipment named but framed as observation. B1/B2/B4/B9 do not name a specific method or tool.
4. Why / Business Impact	5/10	5 of 9 connect to an outcome. B1: customer throughput + onboarding efficiency. B2: waste reduction. B3: batch consistency for pharmaceutical applications. B6: 12% waste reduction. B7: high-value intermediates context. The safety bullets (B4, B5) and Deepak Nitrite observational bullets (B8, B9) state no outcome — what was preserved, prevented, or enabled is absent.
5. Personal Ownership	8/10	8 of 9 bullets use first-person active ownership framing. B5 ("Actively participated") is the only exception — "participated" is a weak verb that signals presence rather than contribution. All other bullets — Managed, Monitored, Operated, Issued, Applied, Conducted, Performed — describe the candidate as the actor, not a supporting player.
6. Context / Stakes	5/10	5 of 9 provide meaningful scale or stakes context. B1 (1000+ customers/day, 4 departments), B2 (high-turnover perishable section), B3 (pharmaceutical-grade API synthesis downstream), B7 (2,760 MT/year facility), and B6 (2 production lines) all anchor their scale. B4/B5 list counts but don't frame consequences. B8/B9 have no context.

Criterion	Score	Observation
7. Action Verbs	8/10	8 of 9 openers are strong and specific: Managed, Monitored, Operated, Issued, Applied, Operated, Conducted, Performed. "Performed" and "Conducted" are generic but not prohibited. B5 ("Actively participated") is the only failure — "participated" describes presence rather than action. No "Responsible for," "Helped," "Assisted," or "Supported" anywhere on the resume.
8. Bullet Quality Consistency	4/10	Tier distribution: B6 (★★★), B1/B2/B3 (★★), B4/B5/B7/B8/B9 (★). 5 of 9 bullets are ★ level — duty descriptions with no accomplishment framing. The entire Deepak Nitrite section is ★. The spread from ★ to ★★★ across the same resume signals inconsistency in how different roles are framed. If the ★ bullets are rewritten, this score moves to 7–8.
OVERALL SCORE	60/100	★★ — Strong Foundation, Clear Path to ★★★ Raw: 48 × 1.25 = 60.0

The Good News

You're at 60/100 with real process engineering experience, pharmaceutical-grade production context, and a Lean Six Sigma result on the resume. That's a meaningful foundation. The gap to ★★★ isn't a content problem — you have the right background and the right instincts around quantification. It's a framing problem: half the bullets describe what you did rather than what it produced. The three Deepak Nitrite bullets need outcomes. The safety bullets need results attached to their volume counts. None of this requires fabricating anything — you were there, things happened, you're the one who knows what they were. The distance between a 60 and a 75 is one honest pass through your internship records asking: what actually changed, improved, or got released because of my work? Write those answers into the bullets.

→ Want Help Fixing All of This?

This audit covered your top 4 bullets. The other bullets on your resume have the same potential — and your background in pharmaceutical-grade process engineering is a differentiator that most candidates at this stage don't have. It just needs to be written like it is.

The 21-Day Accelerator Program — 3 × 90-minute 1-on-1 sessions:

1. **Resume Rebuilt** — every bullet rewritten with the Impact Bullet Builder formula: the Deepak Nitrite role transformed from observation logs into engineering contributions, your PTW and PSSR/HIRA safety work written with outcomes, and your DMAIC result used as the anchor standard for everything else
2. **Interview Stories Mastered** — master story bank built so you can answer any behavioral question cold, with your 12% waste reduction project, ECH production quality work, and safety management experience ready as concrete engineering examples
3. **Live Mock Interview** — full practice with direct feedback on delivery, story structure, and where your technical credibility is being left on the table

You leave with: a rebuilt resume, master story bank, mock interview notes, all session recordings, and 40+ bonus materials.
